*Note, when I refer to objects, I mean physical objects, not program objects. The users would be using this program to assist in collecting real life things, or objects. I don't think it will get confused but just in case.

	Urgent	Not Urgent
Important	**Do - (Your MVP)** • User can make objects. • User can modify objects after creation. • User can choose to see a detailed or simple list of already created objects. • Basic session saving. • Two object categories.	**Schedule - (For V2.0+)** • More than two object categories. • Actors are a class of their own rather than being listed with objects. • More idiot-proofing. (Theatre people don't read instructions. I should know. I am/was a theatre person.) • Transferring objects between categories. • GUI • Organize objects by show.
Not Important	**Delegate - (Use a library)** • Importing and exporting objects. • "User collaboration" via google drive or similar. • Multiple people can see how collection progress is going.	**Delete - (Cut it)** • Collection progress bar • Warnings related to objects (food expiring, fragile garment, ect) • During a show section including when and object is needed, who brings it on and off, who needs to handle it, ect.
